Simple Testing Checklist

A plain-language, click-by-click checklist anyone can follow to confirm the software is working — no technical knowledge needed.

How to use this: for each row, do the "What to do" step, then check whether you actually see the "What you should see" result. Tick the box if it matches. If it doesn't match, write down what happened instead so it can be looked into.

Prepared: September 2026

Before You Start

A few things to know before testing

1. You'll need a few different logins to test everything — ask whoever set up the system for a login for each of these: **Admin**, **Therapist**, **Front Desk / Scheduler**, **Biller**, and a **Patient Portal** login. If you only have one login, just test the sections that match it and skip the rest.
2. Use a **test patient**, not a real one, for anything that creates or changes data.
3. Go through the checklist **in order** within each section — later steps sometimes depend on something you did a step or two earlier (e.g., you can't sign a note until you've written one).
4. "Click" also means "tap" if you're testing on a phone or tablet.
5. If something doesn't match what's expected, that's a real finding — write it down (what you clicked, what you expected, what actually happened) rather than assuming you did something wrong.

Tip: Print this checklist, or open it on a second screen next to the software, so you can tick boxes as you go.

1. Logging In

Anyone

#	What to do	What you should see	✓
1	Go to the login page and type in a correct username and password. Click Sign In .	You land inside the app on your home/dashboard screen.	☐
2	Log out, then try logging in again with the wrong password on purpose.	A message says the username or password is wrong. You are NOT let in.	☐
3	Type the wrong password 5 times in a row on the same account.	Even the correct password now gets rejected for a little while (the account is temporarily locked).	☐
4	Log in correctly, then just leave the browser sitting open and untouched for about 15–20 minutes. Then click anything in the app.	You get sent back to the login screen with a message that your session expired.	☐
5	Log out on purpose using the sign-out/logout option.	You're taken back to the login screen and can't see any app pages without logging in again.	☐

2. Scheduling

Admin / Front Desk / Therapist

#	What to do	What you should see	✓
1	Open the Scheduling page.	A calendar appears showing days/weeks with any existing appointments on it.	☐
2	Click + New event . Pick a test patient, pick tomorrow's date and a time, pick a visit type, then click Create .	The new appointment shows up on the calendar at the time you picked.	☐
3	Try to book a second appointment for the same therapist at the exact same time as the one you just made.	The system stops you with an error saying that time is already taken — it does NOT let two visits overlap for one therapist.	☐
4	Click the appointment you made in step 2 and move it to a different time.	The appointment now shows at the new time instead of the old one.	☐
5	Click Cancel on that same appointment and confirm.	The appointment is marked "Cancelled" (it's greyed out or labeled, but not completely gone from the calendar).	☐

3. Patients

Admin / Front Desk

#	What to do	What you should see	☒
1	Open the Patients page and click + New patient . Fill in a fake first name, last name, and date of birth, then click Create .	The new test patient appears in the patient list right away.	☐
2	Type that patient's name into the search box.	The search narrows down to just that patient.	☐
3	Click into the patient to open their chart. Click Edit and change their phone number, then save.	The new phone number is now shown on their chart.	☐
4	Click Invite to portal and enter a test email address.	You either see a confirmation the invite was sent, or a link on screen you could copy and send yourself.	☐
5	Click Deactivate on the test patient.	The patient's status changes to "Inactive" — they're not deleted, just marked inactive.	☐

4. Clinical Documentation

Therapist / PTA

#	What to do	What you should see	✓
1	Open the Documentation page and click New Note . Pick the test patient and a note type (e.g. "Daily Treatment Note").	A blank note opens with sections down the side (Subjective, Objective, Assessment, Plan, etc.).	☐
2	Type a sentence into the Subjective box. Wait a couple of seconds without touching anything.	A small "Saved" indicator appears — you didn't have to click a save button.	☐
3	Without filling in the Objective or Plan sections, go straight to the Signature section and try to sign the note.	The system blocks you and lists what's still missing (e.g. "Objective findings are missing").	☐
4	Go back and fill in the missing sections, then sign the note again — check the attestation box and confirm.	The note is now marked "Signed" and turns read-only (you can't type into it anymore).	☐
5	Try clicking into any field on that now-signed note.	Nothing is editable — the fields don't let you type.	☐
6	Click Create Addendum , type a short reason and a note, then save.	The addendum appears attached below the original note, with your name and today's date — the original note text is unchanged.	☐

5. Billing

Admin / Biller

#	What to do	What you should see	☒
1	Open the test patient's chart, go to the billing area, and add a charge (pick a service date, provider, a billing code like 97110, and an amount).	The new charge appears in the patient's charge list, marked "Draft."	☐
2	Try adding the exact same charge a second time (same date, same code, same provider).	The system blocks it as a duplicate charge.	☐
3	If the patient has insurance on file, create a claim using the charge, then click Validate .	You see a pass/fail checklist explaining anything wrong before the claim can be submitted.	☐
4	Record a test payment against the patient.	The payment appears in the payment history, and the patient's outstanding balance goes down.	☐
5	Generate a patient statement.	A statement opens showing the balance and a due date.	☐

6. Mobile Care (In-Home PT)

Admin / Front Desk / Therapist / Patient

#	What to do	What you should see	✓
1	As Admin, open Clinic settings → Mobile Care settings and make sure "Enable Mobile Care" is checked. Save.	The setting saves without an error.	☐
2	Open Mobile Care → New Service Request , fill in the test patient, an address, and a preferred date, then submit.	The new request appears in the Mobile Care list with status "Requested" (or similar).	☐
3	Click Generate matches on that request (you'll need at least one test provider with a service area covering that ZIP code set up first).	A ranked list of eligible providers appears.	☐
4	Send an offer to a provider, then log in as that provider and check their Visit Offers .	The offer appears there with limited info (no patient name/address yet), with Accept/Decline buttons.	☐
5	Click Accept as the provider, then schedule an exact time.	The request becomes a real, scheduled home-visit appointment, and the provider can now see the full address.	☐
6	As the provider, open Today's Home Visits and click through Start Travel → Arrived → Start Visit → Complete Visit in order.	The status updates correctly at each step, in that exact order.	☐
7	Log in as the patient (portal) and open In-Home PT .	You see a simple status like "Visit Scheduled" with the date/time and provider name — no technical scoring info.	☐

7. Patient Portal

Patient

#	What to do	What you should see	☒
1	Log in using the patient portal test account.	A simple home screen appears with your next appointment, balance, and messages.	☐
2	Click Book a Visit and go through the steps to book a test appointment.	You get a confirmation screen, and the visit shows up under "My Appointments."	☐
3	On that same appointment (assuming it's far enough in the future), click Cancel .	The appointment disappears from your upcoming list (or shows as cancelled).	☐
4	Open Forms and fill out any assigned form, then submit it.	The form is now marked "Completed" and you can't edit the answers anymore.	☐
5	Open Messages , send a new message to the clinic.	Your message appears in the list you just sent.	☐
6	Open Profile and change your phone number, then save.	You see a message saying the change was submitted for staff review — it doesn't apply instantly.	☐

8. Reports

Admin only

#	What to do	What you should see	☒
1	Log in as Admin and open Reports .	You see tabs like "Operational report," "Billing summary," "AR aging," "Denial work queue," each with numbers/tables.	☐
2	Log in as a Therapist or Front Desk user instead, and try to find "Reports" anywhere in the menu.	There is no Reports option visible at all for that login.	☐

9. Administration

Admin

#	What to do	What you should see	☒
1	Open Administration → Users → Create user . Fill in a fake test staff member and pick a role, then create them.	The new staff member appears in the user list right away.	☐
2	Click that new user, then click Deactivate .	Their status changes to inactive. Try logging in as them — it should be refused.	☐
3	Reactivate the same test user.	They can log in again normally.	☐
4	Go to Clinic settings → Locations and add a test location.	It appears in the location list.	☐

10. Making Sure Two Clinics Can't See Each Other

Super Admin (or ask whoever manages the platform)

This is one of the most important checks — it confirms one clinic can never accidentally see another clinic's patients or data.

#	What to do	What you should see	☑
1	Get a login for Clinic A and a separate login for Clinic B (two different organizations).	Both logins work independently.	☐
2	Create a test patient while logged in as Clinic A.	The patient appears in Clinic A's patient list.	☐
3	Log out, then log in as Clinic B, and search for that same patient's name.	Nothing is found — Clinic B cannot see Clinic A's patient at all.	☐

Summary

Once you've gone through every section above, count up how many boxes you were able to check. Anything you couldn't check — write it down with:

- Which numbered step it was
- What you expected to happen
- What actually happened instead

Hand that list back so it can be looked into. That's it — this checklist doesn't require any technical background, just following each row in order.
